What Is Time Series Forecasting

To begin laying the foundation for the theory behind time series forecasting. Let us first start by defining what is forecasting? As well as what is time series data ? From there we can combine the two concepts together to define time series forecasting.

What is Forecasting?

Forecasting is the science of predicting the future with historic time series data. There are many scenarios in both our day to day life as well as in business where forecasting is critical to our planning and goals.

For example, in our personal life we make look at a weather forecast to determine if it is the best time to go on a camping trip. Alternatively, a business owner may want to forecast the demand of a product so that the appropriate inventory can be ordered. Some things are easier to forecast than others, for example the time of the sunrise tomorrow morning can be forecasted precisely. Whereas, forecasting tomorrow's winning lotto numbers **cannot** be forecasted with high level of certainty.
